THE PROBLEM

The problem *we're solving*

PROBLEM STATEMENT

PS-04 · AI Decision Engine for Business Data
CRM records, finance sheets and pipeline trackers drift out of sync, so decisions get made on stale or conflicting data.

WHO FACES IT

A sales ops or revenue team lead who has to trust a CRM number without knowing whether finance's version still agrees with it.

WHAT IT COSTS THEM TODAY

Hours spent manually cross-checking CRM vs. finance vs. spreadsheets before every decision — and when that check gets skipped, decisions get made on data that's already wrong.

SOLUTION OVERVIEW

What *we're building*

IN TWO OR THREE LINES

An AI decision engine that scores every business fact's trust from staleness and cross-system agreement, debating only when data genuinely conflicts.

WHAT THE USER DOES

Asks a business question spanning CRM, finance and pipeline data — or lets the engine monitor these sources continuously in the background.

WHAT THEY GET BACK

A decision with its full evidence trail and confidence score, plus — whenever data conflicted — the rejected counter-argument explaining what lost and why.

TECHNICAL APPROACH

How *it works*

MODELS

An LLM (Claude, or the team's available free-tier model) powers three agent roles: a proponent, a challenger, and a judge that reconciles conflicting evidence.

TOOLS & FRAMEWORKS

A rule-based staleness/agreement scoring engine (no LLM calls) gates a lightweight multi-agent debate layer (LangGraph or a custom state machine), connected to CRM, finance and pipeline data via simple APIs.

DATA

Synthetic CRM, finance and pipeline datasets generated with Faker, with deliberately injected conflicts and staleness for testing and the live demo.

HUMAN APPROVAL

Every reconciled decision is shown with its full evidence trail before a human approves the final action — the system never auto-executes.

KEY FEATURES

What it will do *by 1 Oct*

- | | | |
|----|---|---|
| 01 | Objective Confidence Decay | Every fact's trust score decays automatically from staleness and cross-system agreement — never from an LLM's self-assessment. |
| 02 | Confidence-Gated Debate | Clean, agreeing data gets an instant answer; only genuine conflicts trigger a structured multi-agent debate. |
| 03 | Cross-System Conflict Reconciliation | When CRM and finance disagree, opposing agents argue each side from real timestamp and audit-log evidence, and a judge decides. |
| 04 | Counterfactual Explainer | The losing argument from every debate is kept and shown alongside the decision, so humans see what was rejected and why. |
| 05 | Human-in-the-Loop Approval | No decision executes automatically — every recommendation waits for explicit human sign-off. |

BASELINE & EVALUATION

How we'll *prove it works*

TODAY · WITHOUT YOUR SYSTEM

~25 min per decision

Time spent manually reconciling CRM, finance and spreadsheet numbers before trusting a decision — and conflicts that go unnoticed when that check gets skipped.

TARGET · WITH YOUR SYSTEM

<1 min per decision

Every genuine data conflict caught and reconciled automatically, with zero silent contradictions reaching a decision-maker.

HOW YOU'LL EVALUATE IT

A synthetic test set of ~50 records with a known number of injected conflicts, measured on conflict-detection recall, reconciliation accuracy against ground truth, and time-to-decision — failures caught by comparing engine-flagged confidence against the manually verified data state.
